ZIRON MEDIA
Discovering Together!

Dear Maxline Team,

Following our recent meeting regarding the integration of Flotilla's services with Maxline Globals, I would like to summarize the key points and explore possible solutions for both the Tracking and Booking APIs.

Tracking API

Currently, the only straightforward solution available for tracking is to **embed Flotilla Cloud into Maxline Globals tracking page via an iframe** or by providing a **backlink to a Flotilla-hosted custom tracking page** styled with our brand colors and logo. However, this approach has the limitation that it **does not fully align with our web UI/UX design standards** and results in inconsistent user experience.

If possible, we would prefer to implement a more seamless integration, where Maxline Globals can send a **secure HTTP POST request** to Flotilla Cloud and receive the tracking response data in **JSON format.** This method would allow us to fully customize the frontend experience in our Next.js application while maintaining secure and reliable communication.

Booking API

For booking integration, our developers plan to send you **sample JSON data** collected from customers via our Next.js frontend. The data will first be stored in our VPS server's **PostgreSQL database.** We propose two possible workflows:

1. Automated Booking:

We send the collected booking data from our server directly to the Flotilla application via a Booking API. This approach would allow for **automated, real-time booking creation** within Flotilla.

2. Manual Booking:

Alternatively, we can set up a backend interface for Maxline Globals' team to access the booking requests. The team would then manually enter all details into the Flotilla application. For backup and auditing purposes, **all customer booking requests will be securely stored in our database,** and the Maxline team will **receive email notifications whenever a new booking request is received**. We acknowledge that **this manual process may introduce some delay** compared to full automation.

We look forward to discussing any other possible integration options for the Booking API in future meeting with Flotilla Team.

Security
We understand that Flotilla is committed to keeping data secure, and we want to assure you that our Next.js application and VPS environment are designed with **strong security measures.** We ensure that **all data handled by our platform is protected and transmitted securely.**

Next Steps
Based on the solutions discussed, **we are preparing to move forward with Phase 3 (Frontend Development) and Phase 4 (Backend Development & API Integration)** of the Maxline Globals platform.

We look forward to your feedback so we can proceed accordingly.

Best regards,
Melwin Af,
Web Developer,
Ziron Media FZ-LLC.
